Lindo Nurseries

CHICO, CALIFORNIA

1945 Price List

Because of material shortages and labor scarcity this simple price list will replace our usually more elaborate catalog this year.

There is, however, no scarcity of plants in our nursery nor are the types or varieties limited. The fact is, we are offering some especially rare and choice varieties in Camellias and, while the early demand indicates a very heavy drain upon our stocks, we are still making complete delivery on all orders. But should it occur that we are unable to fill your order completely we will, as in the past, substitute the next larger size or omit the item and make you a refund. We do not substitute varieties without specific authorization, and then we prefer that you indicate a second choice.

Lindo Nurseries have specialized in growing and developing Camellias for over thirty-one years. Starting with scarcely a dozen varieties we now have over five hundred and are distributing them throughout the Nation wherever climatic and soil conditions are suitable.

Prices in this list are f.o.b. Chico, California. All transportation charges are to be paid by purchaser. We exercise great care to ship by the cheapest and best routes and to secure the lowest rates on all shipments. Residents of California will please enclose 2½% State Sales Tax.

TERMS. Cash with order, except for customers having established charge accounts.

WARRANTY. Our varieties are guaranteed true to name and description under which they are sold. While there is great confusion in nomenclature and many varieties are sold under various synonyms, we are constantly on the alert for these synonyms and sell our plants under the names most generally accepted.

CULTURAL HINTS

EXPOSURES

Camellias do not thrive in full shade. In such an exposure good foliage and good flowers will result but flowers will be very few in number. The most favorable exposure is full morning sun and shade during the afternoon. Give them as much sun as they will stand without burning the foliage.

SOIL

Camellias should have a loose friable soil which can be secured by a mixture of $\frac{1}{3}$ loam, $\frac{1}{3}$ leaf mold, and $\frac{1}{3}$ peat moss. These ingredients also produce an acid condition. Good drainage is absolutely necessary, and can be produced by digging a deep hole and filling the bottom portion with gravel.

PLANTING

Dig a hole 1 foot larger than the diameter of the root ball of the camellia. Fill this with the soil mixture mentioned above. Firm the soil to prevent the ball from settling. Place the camellia so that the top of the root ball is level with the surrounding soil. Leave a basin well around the plant and flood with water. Never plant camellias deeper than grown in the nursery.

WATERING

Water Camellias thoroughly after planting. Thereafter keep the soil uniformly damp but not soggy. Never permit the soil to dry out and cake. The feeder roots in the top few inches of soil cannot take nourishment from dry ground. Water plants overhead as the foliage never mildews and washing the leaves is beneficial.

FERTILIZING

One should use an acid reacting fertilizer, sold by most nurseries. Apply about February 15. Loosen the top half inch of soil; apply two handfulls of fertilizer around a small plant, more around larger bushes. Water immediately. Repeat application of fertilizer once a month through July.

CULTIVATING

Camellias are top feeders and should never be cultivated deeply. It is well to keep the surface of the soil loose so that water will permeate. This is especially desirable after fertilizing. A mulch of peat or lawn clippings is excellent for keeping the ground loose and cool and for water retention.

DISBUDDING

Camellias very often set more buds than it is desirable for a plant to mature. To mature an excessive number exhausts the plant and sometimes results in small, inferior flowers. Leave but two buds to each terminal for quality flowers taking care to not injure the leaf bud in removing the flower bud.

PICKING

A Camellia bush can be ruined by improper picking of the flowers. Flowers wanted for floating in a shallow bowl can be twisted off the stem. Those for corsages should be cut with a knife or shears, taking only two or three leaves with each flower. Avoid cutting below the current season's growth.

PLANTING SEASON

Under favorable conditions Camellias can be planted any month of the year if bought in containers and if the root system is not disturbed in planting. Transplant balled plants during fall, winter and early spring while the plants are dormant. In our nursery we ball Camellias from early October through the middle of April.

BALLS OR CONTAINERS

To accommodate Camellia buyers who prefer plants in containers we grow some stock in gallon cans. The greater part however are grown in the ground under lath and must be balled. Because of the light friable condition of our soil it fuses easily with the soil in the new location to which our plants are moved when sold. This adds much to the ease with which our plants grow and become established in their new homes. We pride ourselves on the vigor of our plants.
